

Taking OUT the trash

Team U2: Enson Chew, Jayden Tan, Fang Xinzhuo, Kouta Ono-Wong

(Due to how slides render small images, pixel art appears blurry)

Game Concept

Things are often forgotten or discarded. An old toy, an older model. Nowadays, we throw away functional and old items without a second thought. A newer model, a small stain, is enough reason to discard it.

In this game, you are an old toy, discarded without a second thought for a newer model. You will fight off waves of enemies with various makeshift weapons, trying to return to your owner.

Target Audience

Anyone! All of us have thrown away something before. Anyone with a keyboard and mouse can play.

Aim of the Game

Fight off waves of trash of increasing difficulty to get cash to buy new or upgraded weapons and reunite with your owner.

Game Features / Mechanics

You start off with a basic broom. Different kinds of enemies (basic, tanky, speedy, shooter) will attack at you from all parts of the map. You can kill them to get cash, and at the end of each round. You can access the shop to buy up to 3 weapons.

Enemies have varied stats and will pathfind to you wherever you are on the map. Weapons vary from close range melee weapons to automatic roombas that mow down enemies.

Obstacles and walls litter the map. You can use them to your advantage, or get cornered and die. Cheese also spawns throughout, eat it to heal

Why is this fun / unique?

Our game takes the classic roguelike formula and mixes it up with a mix of time-based gameplay to heavily reward skill but still remaining playable for newer players.

Our game is also unique from other games such as Brotato as we have walls and obstacles. To allow enemies to navigate these walls, we used a tile-based pathfinding system to navigate walls as well as raycasting to allow enemies to still move smoothly to the player.

All of the game textures are also handmade by us in a pixel art style. Most game audio is from Pixabay with some made in sfxr.me

Design choices

The art type was chosen to be pixel art as our team had some experience in pixel art. Allowing us to better keep a consistent style to the art. A tileset was used for the maps, allowing us to easily change and design maps that feel fair. ALL of the pixel art in the game was made by us (the font in these slides are not)

The art style of the tileset follows a rusty old metal theme, complementing the location of the gameplay in the story (a trash bin) We used a top down perspective as it is the most suitable for roguelites. We kept the resolution to 16x or 32x to not overcomplicate the game and complement the chiptune music.

Technical Implementation

In games like Brotato, there are no walls and obstacles. Hence, enemy pathfinding is as simple as enemies moving towards the player. However, to add some variation to the gameplay, we've added walls and obstacles in the map. However, this makes enemy movement more complicated. Firstly, originating from the player, each tile in the map gets a direction (up down left right) towards the player or a tile that eventually leads to the player. Then each enemy casts a ray towards the player. If the ray does not hit any collision boxes, the enemy will move directly to the player. If it is obstructed, the enemy will travel the direction indicated by the tile it is on. Hence, all enemies will make their way to the player even if there are walls.

Future Expansions

Our game is fairly replayable, however, due to time constraints, we do not have enough variability in weapons. However, using OOP, our game is easily expandable and we can easily add new weapons and enemies.

An upgrade system is also missing, which is common among other roguelikes and bullet-hell games.

The game's balancing will also likely be tweaked in future versions. For example, enemies will take knockback and if possible a final boss will be added to enhance the storyline

Thank you!
